# Design and Fabrication of Series Elastic Actuator for Humanoid Robot Applications

By,

Jonathan Jenkins

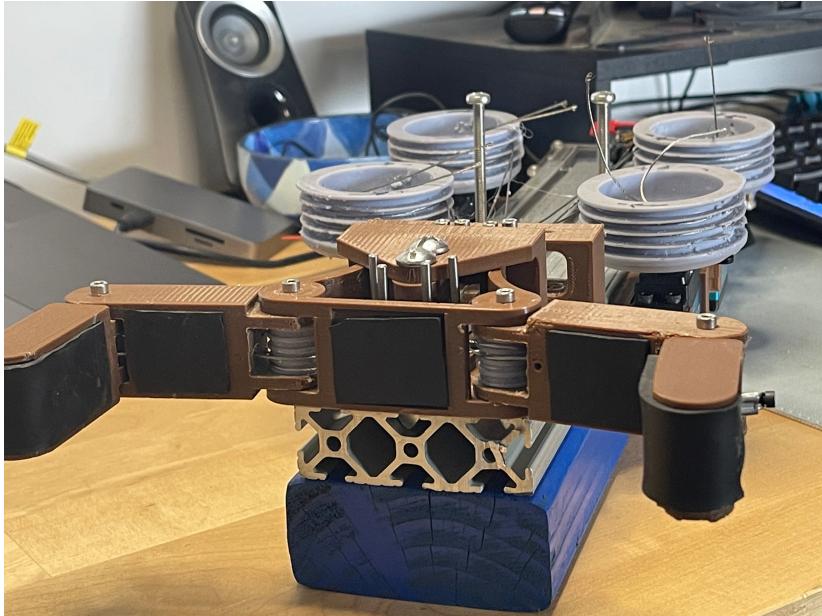

# Humanoid Robotics

- ▶ Specifically design to operate in unstructured environments.
- ▶ Bridge the gap between industrial robots and humans.
- ▶ Compared to industrial robots humanoid robots have improved:
  - ▶ Dexterity
  - ▶ Locomotion
  - ▶ Sensory feedback
  - ▶ intelligence

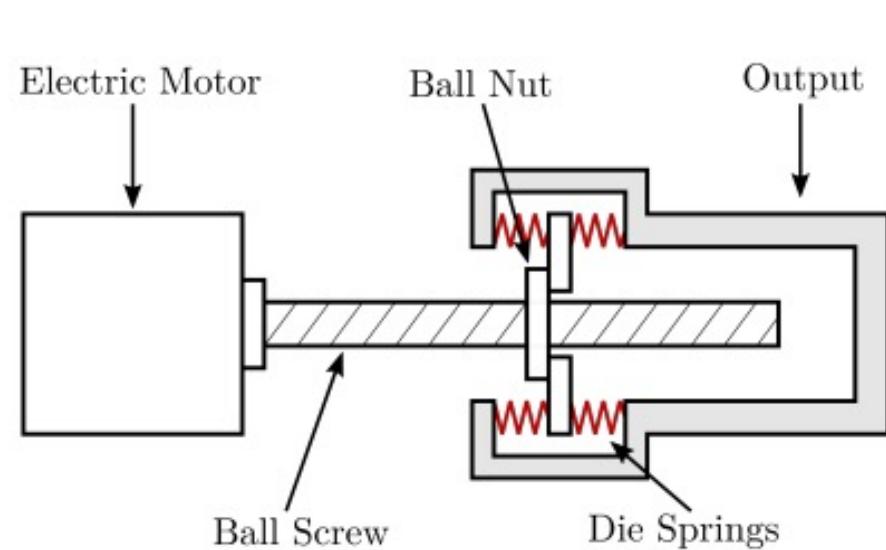

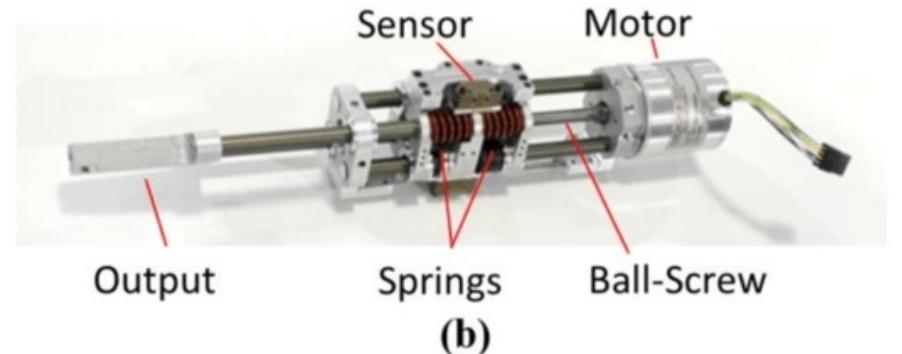

# Robotic Gripper Overview

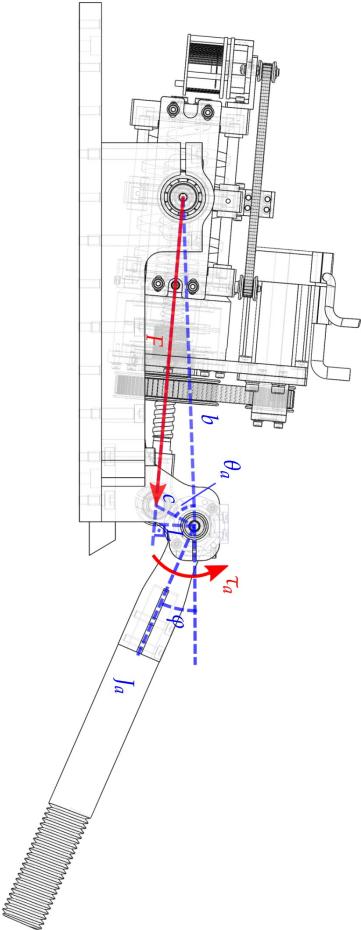

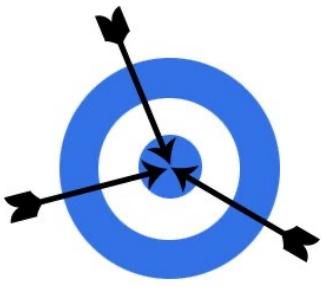

- ▶ Project 2 : 2 Finger Gripper
  - ▶ Cable Driven
  - ▶ 4 DOF
  - ▶ 4 servo
  
- ▶ Needs Improvement:
  - ▶ Dynamic force Feedback
  - ▶ Built In Compliancy
  - ▶ Larger load
  - ▶ Improved Electronics control/power

# Series Elastic Actuator

- ▶ SEA contains an elastic element in series with the mechanical actuator.
- ▶ The elastic element gives the actuator a level of mechanical compliance
  - ▶ impact tolerance.
  - ▶ high force fidelity (control)

# SEA Test Rig Requirements

- ▶ Elastic Element:
  - ▶ Compliant elastic element
- ▶ Force sensor:
  - ▶ ability to measure load applied
- ▶ Position sensor:
  - ▶ ability to measure arm position
- ▶ Stability:
  - ▶ Ability to have a precise and constant sensor reading with minimal drift or noise
- ▶ Size:
  - ▶ Relatively compact and design that can be optimized later
- ▶ Power:
  - ▶ Ability to lift a mass of 15 lb force

# Design & Manufacturing

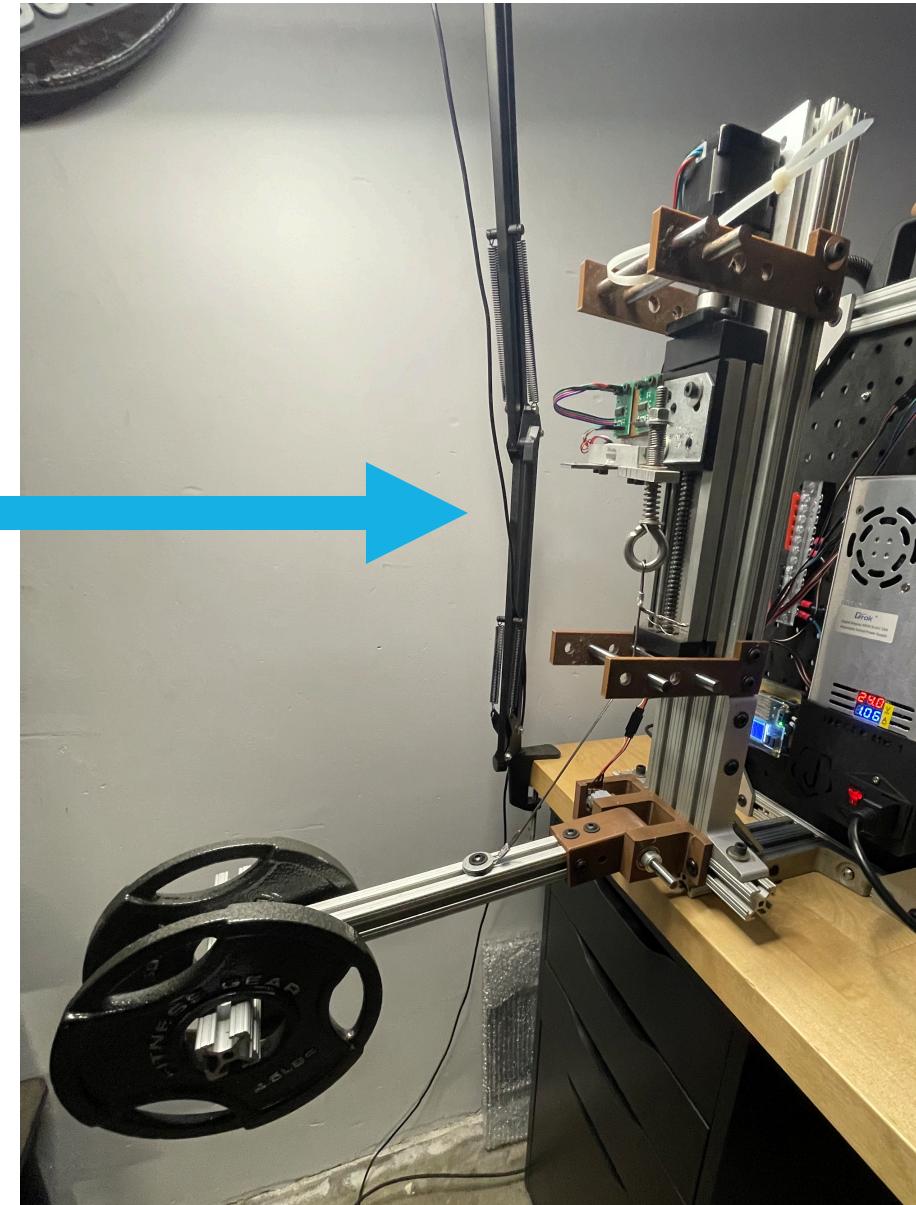

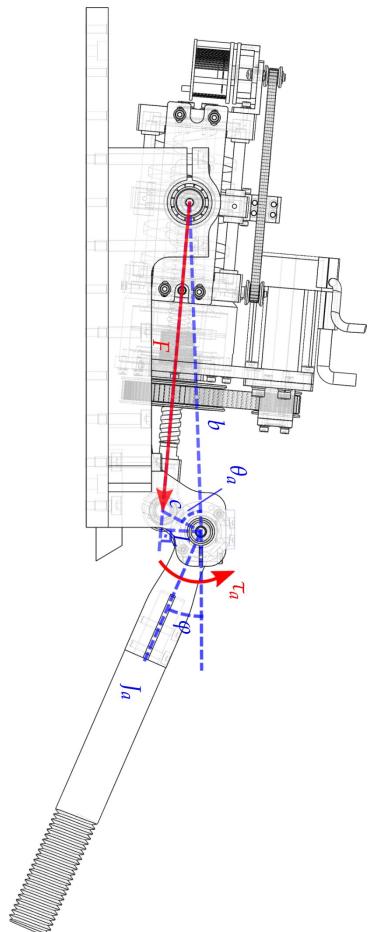

Fusion 360

3D Printing

CNC

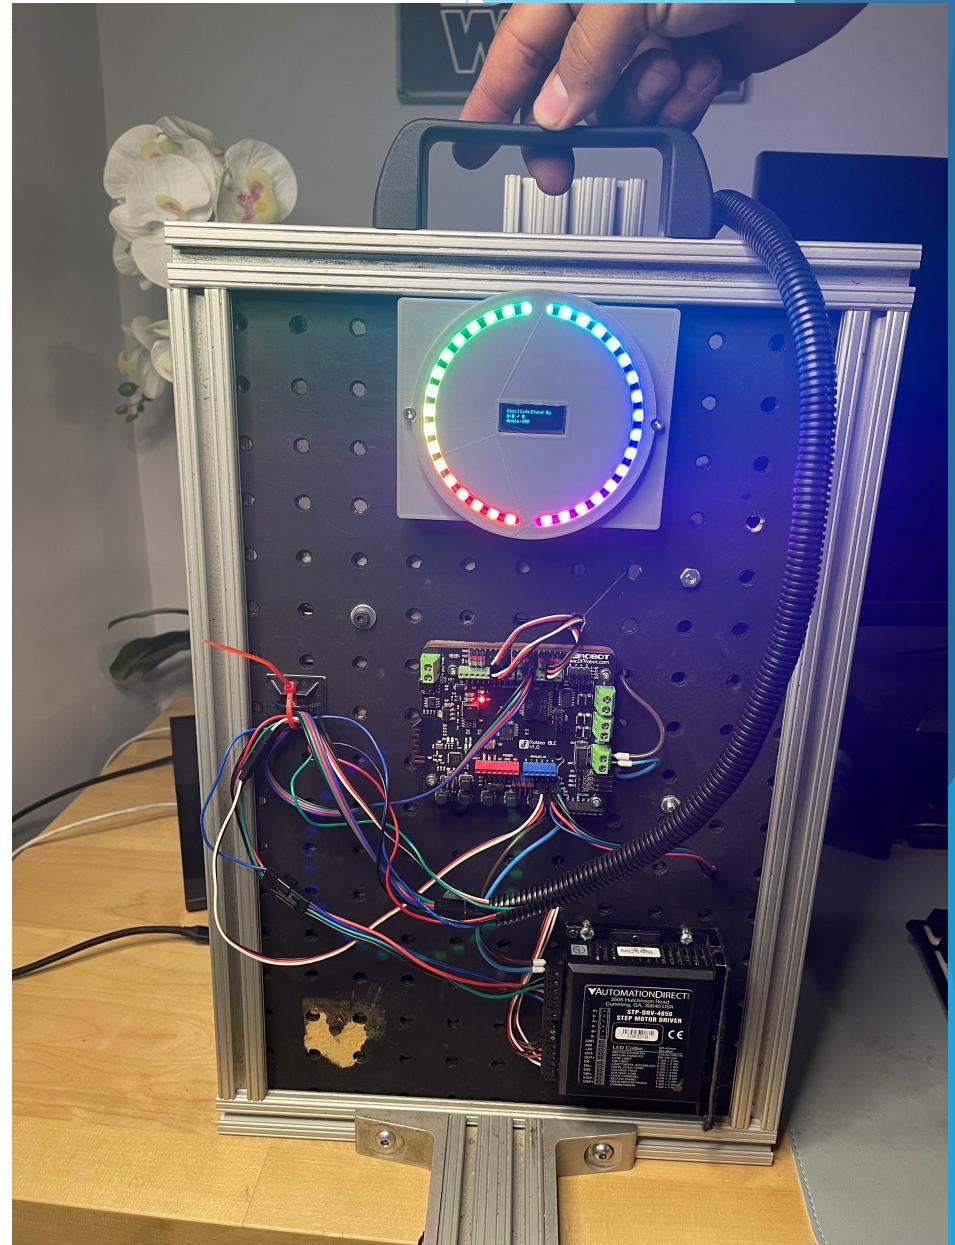

Assembly

Coding

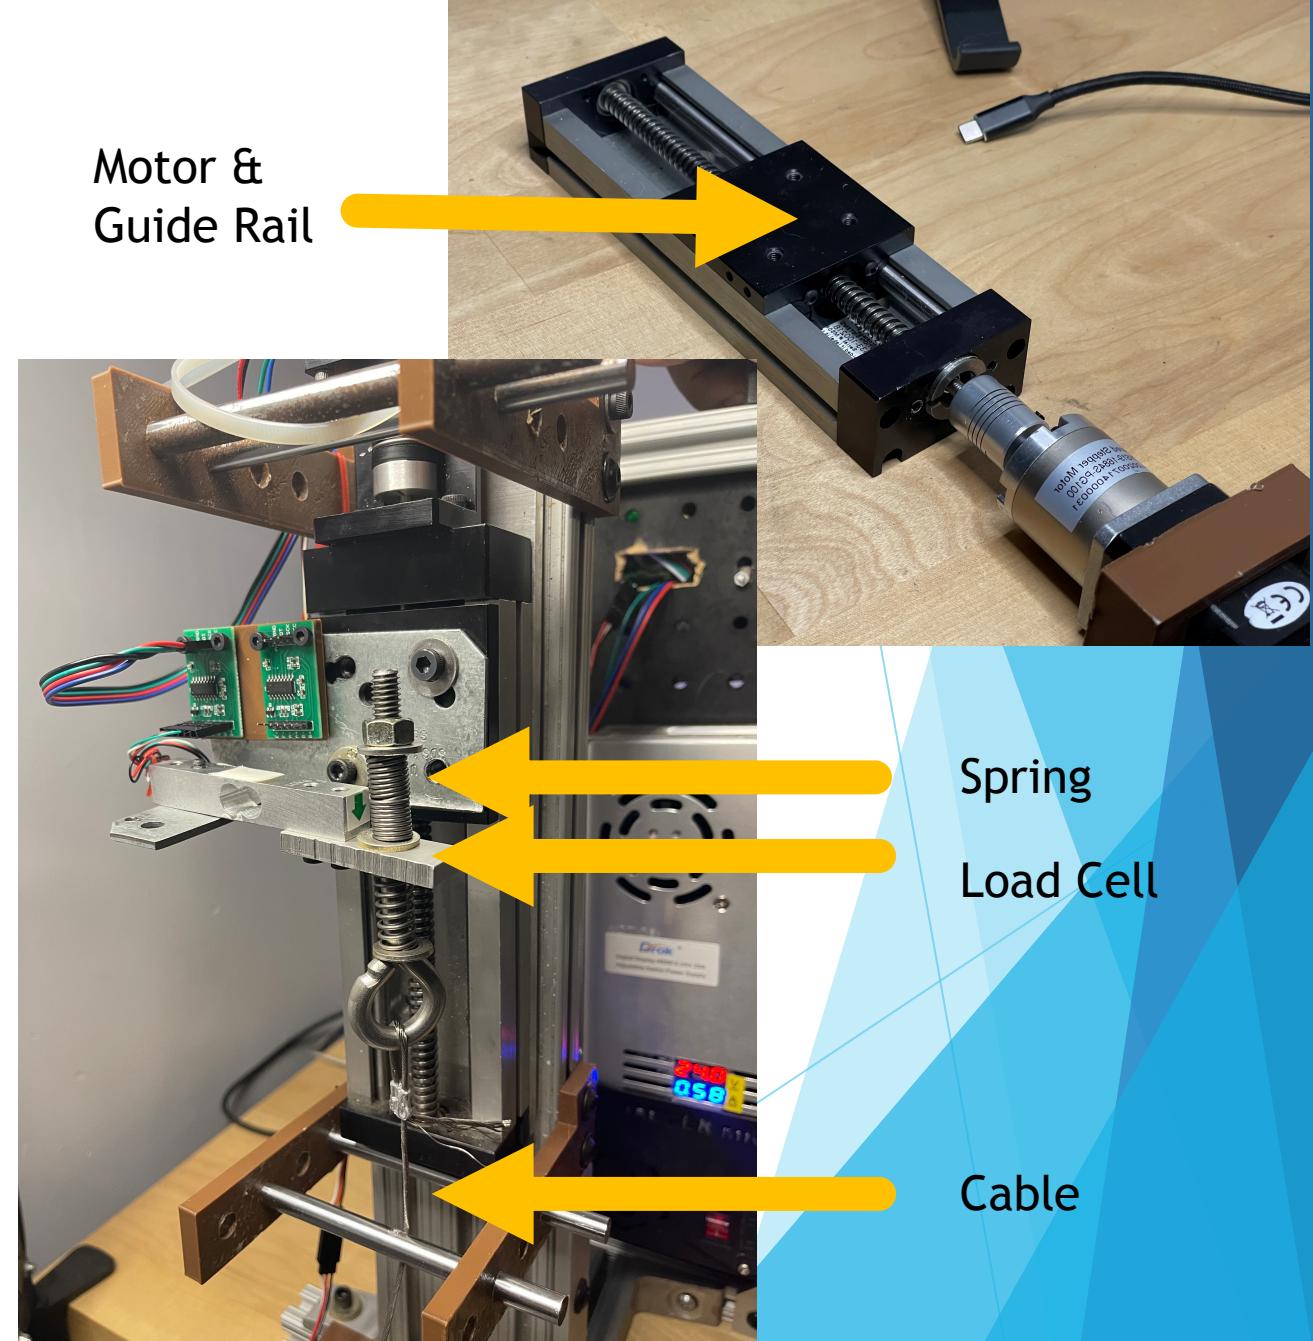

# Control Unit

- ▶ Upgraded to a 24 V Power supply
- ▶ Romeo BLE - A Control Board for Robot - (Arduino Uno ) - Microcontroller
- ▶ Stepper motor Driver
- ▶ 32 Pixel LED ring for visual feedback
- ▶ 124 x 64 OLED for quantitatively feedback

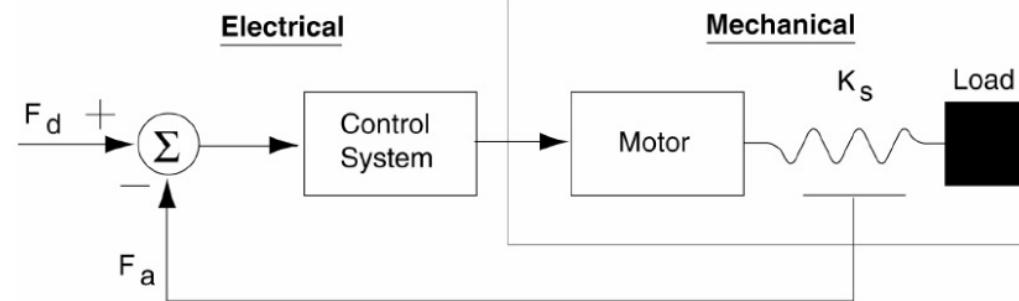

# Actuator

- ▶ Linear Rail with lead screw and carriage
- ▶ Actuator
  - ▶ 100:1 Nema 17 Stepper motor
    - ▶ 30 LB
    - ▶ Very Slow / low dynamic compliancy
  - ▶ Nema 17 Stepper motor
    - ▶ 30 LB
    - ▶ Very Slow / low dynamic compliancy
- ▶ 10 KG load cell with analog to digital converter
- ▶ Cable “tendon” connected to load cell in series with springs

# Forearm

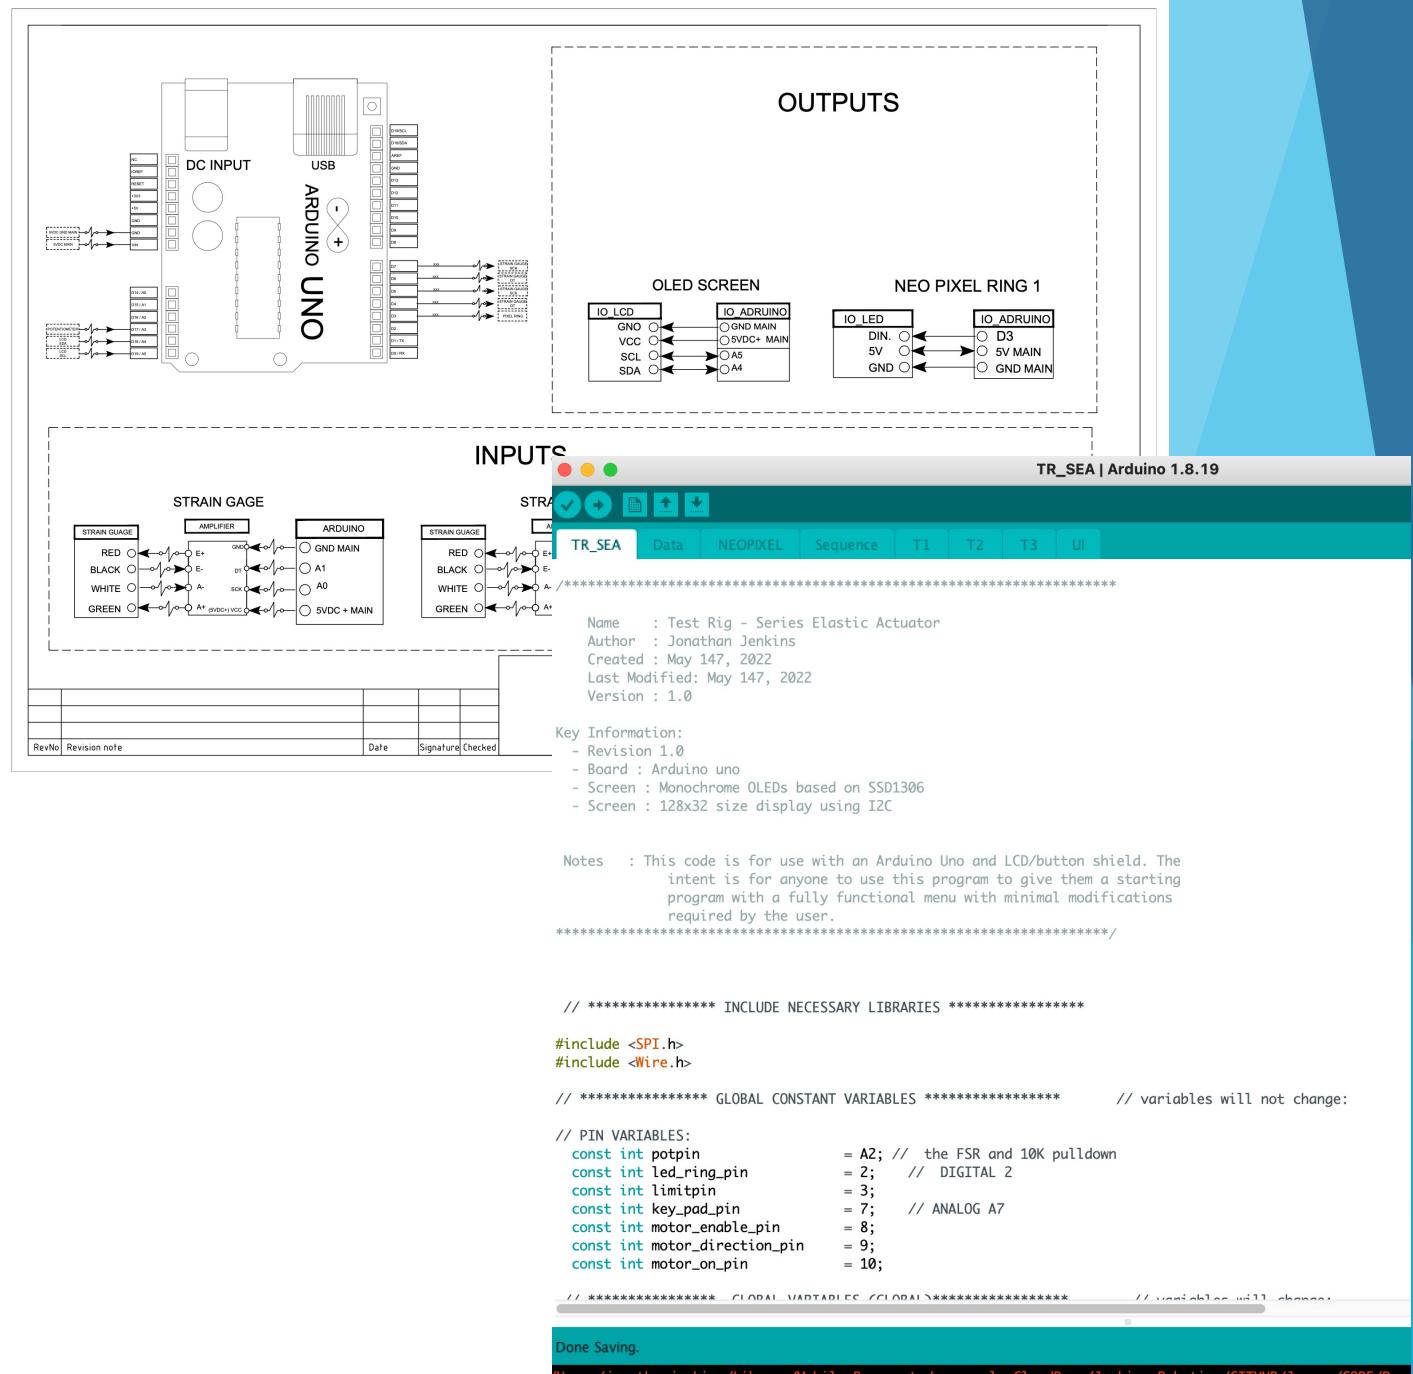

- ▶ Angle and Force data are used to make a close feedback control system
  - ▶ Desired Force and measured force
  - ▶ Desired angle and measured angle

Potentiometer

Load / Arm

# Programming

- ▶ Program the force calculations
- ▶ Program the compliant feedback
- ▶ Program the sensory/haptic feedback
- ▶ Calibrate the system with known weights

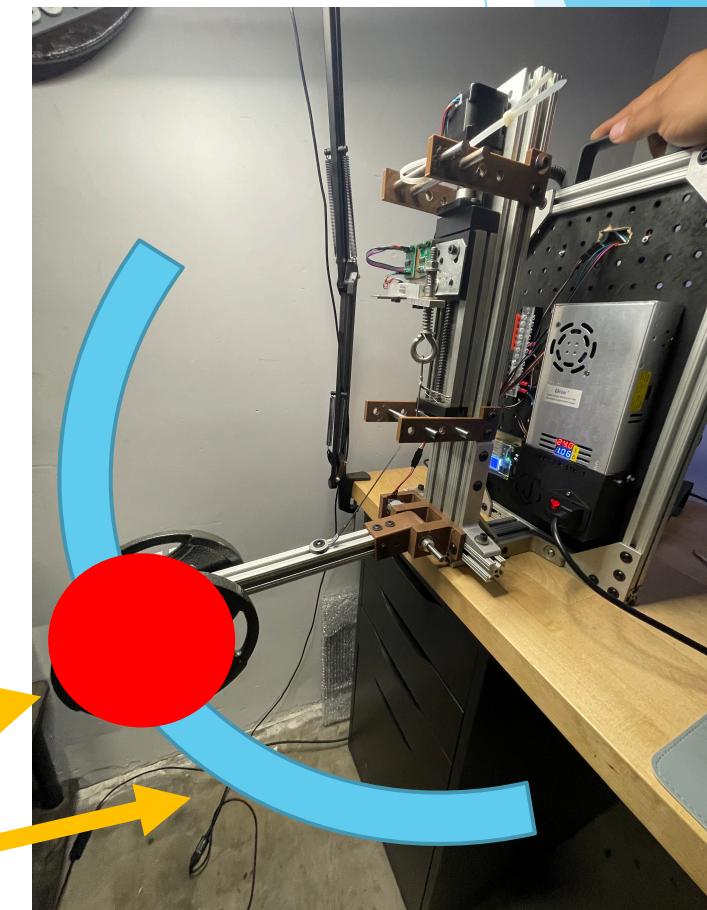

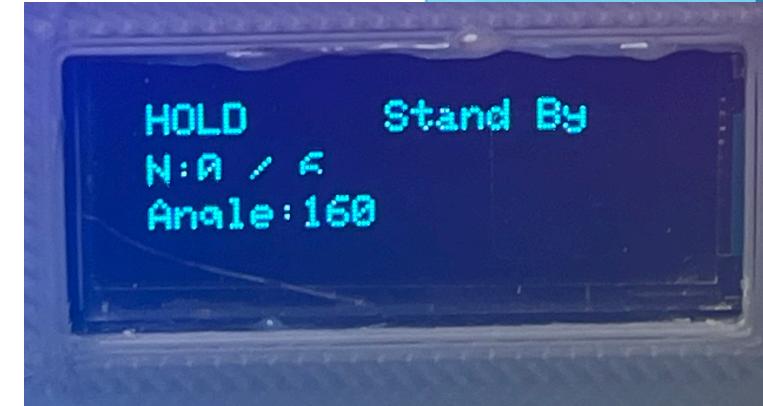

# DEMONSTRATION & ANALYSIS

# Dynamic Position Hold

- ▶ Sets the desired load you want the actuator to tolerate
- ▶ Compliant feedback allows operator to manually change the arm position
- ▶ Actuator will hold new position

Hold Position

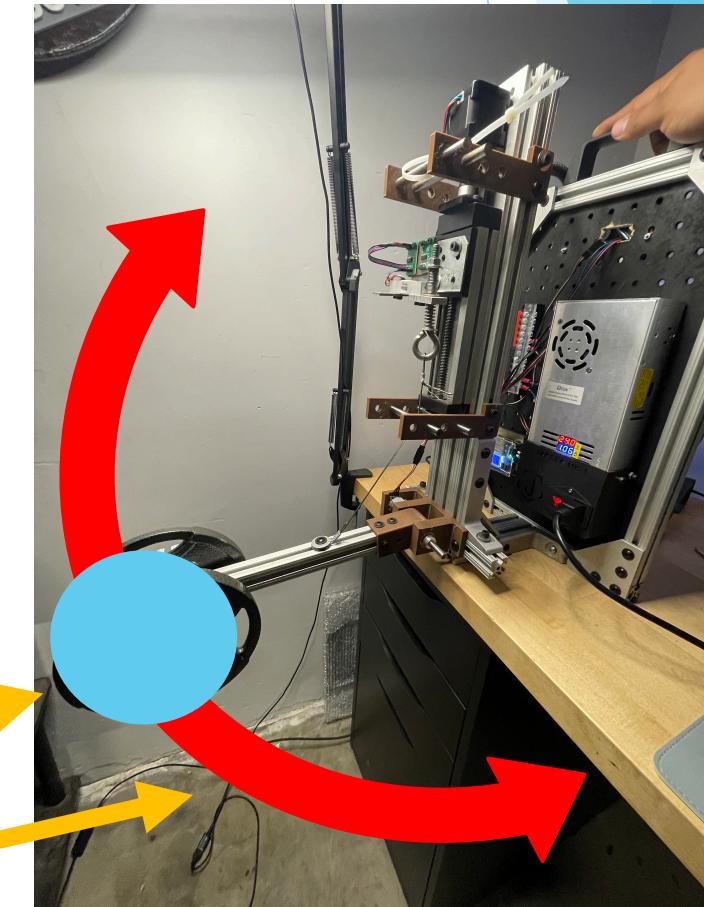

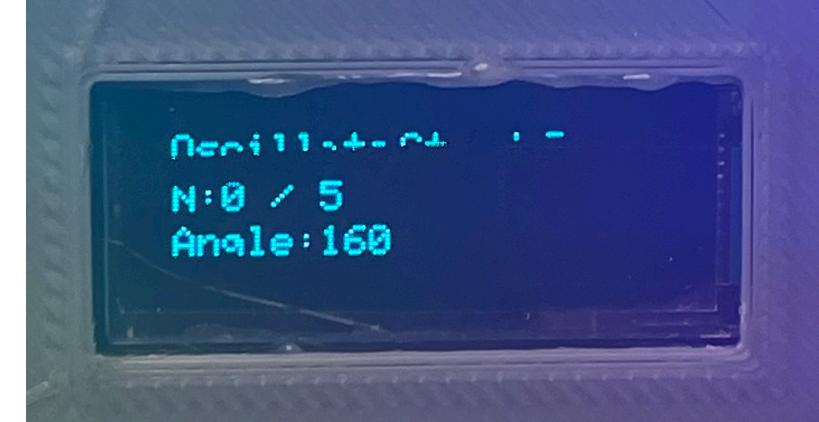

Allowable range

# Dynamic Oscillation

- ▶ Sets the desired load you want the actuator to tolerate
- ▶ Compliant feedback allows arm to be held at any position during its motion to comply with external forces

Load Position

Oscillation range

# Conclusion

## The Good

---

- ▶ Successfully detects force and Complying with external interaction
- ▶ Improved Power system and controller
- ▶ Demonstrated decent power

## The Bad

- ▶ Noticeable delay in the detection of force and the reaction of the actuator
- ▶ Actuator is to weak
- ▶ Actuator is to slow
- ▶ Potentiometer is noisy
